About The Utilities Telecom Council

UTC is widely recognized as the top global expert in utilities telecommunications management. Since its founding in 1948, UTC has become a top information resource for electric, gas, and water utilities, natural gas pipelines, other critical infrastructure providers, and other industry stakeholders. UTC also provides management and support services for several independent organizations including, UTC Canada, the European Utilities Telecom Council, the Smart Networks Council, the United Power Line Council, the UtiliSite Council, and APTEL in Brazil. UTC also works closely with federal, state and provincial governments in North America and the European Union.

From its headquarters in downtown Washington, DC, UTC provides information, products and services that help members:

- Manage their telecommunications and information technology systems more effectively and efficiently;
- Voice their concerns to legislators and regulators;
- Identify and capitalize on opportunities linked to deregulation worldwide; and
- Network with other telecom and IT professionals.

UTC is also an authorized certified frequency coordinator for the Private Land Mobile Radio Services below 512 MHz and 800-900 MHz frequencies, the sole frequency coordinator authorized to coordinate channels previously allocated exclusively to the Power Radio Service in the U.S. UTC also coordinates utility telemetry use in the 200 MHz and 1.4 GHz bands and helps members with higher-frequency fixed wireless licensing. In addition, UTC maintains the national Power Line Carrier (PLC) database for the coordination of PLC use with licensed government radio services in the 10-490 kHz band.
